

Picture of logger with keyboard.

This equipment is used for recording the grouting process. A logger is used for recording the pressure and weight signals coming from a concrete pump. When the grouting pump is started the recording is also automatically started. Additional data for the identification of the section, hole and length of the hole can be supplied manually with the recording.

The data is stored in ASCII format for later retrieval. Data can also easily be exported to other programs like Microsoft Excel.
